

ABSTRACT

This invention is a device designed specifically for cutting and chopping cabbage comprising of a hollow, metal cylindrical shaped body, measuring two and three-fourths inches in diameter and four inches in length, with a closed top and an open bottom, the wall and top having imperforate smooth interior and exterior surfaces, and the open bottom rim is filed or rubbed down to a smooth, thin, sharp circular cutting means that can be resharpened if it should become dulled from extensive use. The closed top of the cabbage cutter is covered with a permanently affixed cap that extends three-fourths of an inch over onto the wall of the hollow cylindrical shaped body that serves as a hand grip so that the user will be able to maintain a good grip on the device to use it efficiently and effectively at all times. The cap also provides a cushion and support for the hand of the user while he/she is using the device. The device has a removable protective cover, contiguous with the cutting and chopping portion of the hollow cylindrical shaped body, that fits over the cutting and chopping means that serves as a protective shield from injury, and also protects it from becoming damaged, when the device is not in use or stored.
